

Speaker Cue Cards — Standout Projects

Rehearse out loud. Hook → pause → story → the hard part → landing line → stop.

OPEN — 30-second pitch

"I'm an AI Application Engineer — I use AI to turn ideas into production apps fast. I've shipped 75-plus across five domains. Today: five standouts — an agent control center, an autonomous video pipeline, my own reusable-skills system, financial-intelligence dashboards, and a bank-automation bot in production. The thread through all of them: real, working systems — not demos."

THE FIVE — hook / hard part / land it

01 · CommandCore

Hook: "One chat window that understands what you want — and quietly dispatches the right specialist to do it."

Hard part: Hard part: orchestration — typed tools, persisted memory, restart-safe at 3am.

Land it: "That's the difference between a demo you show once and a system you can depend on."

02 · Beacon

Hook: "Every morning a fresh AI news video gets made — and I barely touch it."

Hard part: Hard part: trust — fact-check BEFORE generate, checkpoint every stage, cost cap, human approves the publish.

Land it: "Automation people trust isn't about removing the human — it's putting the human in exactly the right place."

03 · Skills Hub

Hook: "Here's how I build 75 apps without reinventing the wheel 75 times."

Hard part: Why it matters: 25 reusable skills wired into my AI CLI — compounding leverage, each project speeds up the next.

Land it: "Most engineers ship code. I also ship the system that ships the code."

04 · Financial Intelligence

Hook: "I turn raw market filings into signals a person can act on in seconds."

Hard part: Hard part: messy, noisy data — normalize filings into a glanceable, trustworthy view (loading/error/empty/full).

Land it: "Data is everywhere. The value is in making it decision-ready."

05 · Rent-tracker

Hook: "I had a boring monthly question — who actually paid rent? — so I automated the whole answer."

Hard part: Hard part: the bank fights automation — sessions die headless; fresh visible-browser logins + idempotent runs. (Private — offer a live 2-min walkthrough.)

Land it: "Unglamorous, real-world engineering that saves time every month — running in production right now."

CLOSE — deliver slower, then stop

"Across all five, it's the same engineer working the same way: range across five domains, depth in agents and automation, and the discipline to make it reliable. I use AI as a multiplier — but verifying before generating, capping cost, keeping a human where it matters, that's the engineering."

Final line (look up, pause): "Point me at a problem, and I'll turn it into a dependable, AI-powered product — fast, tested, and in production. That's what I do."

Delivery reminders: smile on the open · pause after every bold claim · don't read bullets aloud · end each project on the landing line and stop talking.
